

**NATIONAL EXAMINATIONS DECEMBER 2018**

**04-BS-2**

**PROBABILITY AND STATISTICS**

**2 HOURS DURATION**

**NOTES:**

1. If doubt exists as to the interpretation of any question, the candidate is urged to submit with the answer paper a clear statement of any assumption made.
2. "Closed Book" – no-aids other than
  - (i) A Casio or Sharp approved calculator
  - (ii) ONE hand-written information sheet (8.5" x 11"), filled on both sides.
3. Any 5 questions constitute a complete paper. Only 5 questions will be marked.
4. All questions are of equal value.
5. Statistical tables of the normal, t, chi-square and F distributions are provided.
6. Questions involving hypothesis testing must be clearly formulated.

**Marking Scheme**

1. (a) 5 marks (b) 5 marks (c) 5 marks (d) 5 marks
2. (A) (a) 5 marks (b) 5 marks ; (B) (a)) 5 marks (b) 5 marks
3. (a) 5 marks (b) 5 marks (c) 5 marks (d) 5 marks
4. (a) 5 marks (b) 5 marks (c) 5 marks (d) 5 marks
5. (a) 7 marks (b) 7 marks (c) 6 marks
6. 20 marks
7. (a) 10 marks (b) 10 marks
8. (a) 5 marks (b) 5 marks (c) 5 marks (d) 5 marks

1. Repeated measurements carried out by the materials and quality control department of Amazing Salt revealed that the weight of salt W contained in the plastic bags sold to the various hardware stores is a normally distributed random variable with mean and standard deviation equal to 39.80kgs.and 0.30kgs.respectively.

- (a) In November 2018 Mr.Happyowner bought a bag of Amazing Salt from a local hardware. What is the probability that the weight of salt W contained in this bag exceeded 39.50kgs? Write down the probability density function of W. Then draw the probability density function of W, neatly and clearly, and indicate the area that corresponds to this probability.
- (b) Compute (i) the lower quartile and (ii) upper decile of the probability distribution of W. Explain briefly the meaning of these results.
- (c) Let M represent the mean weight of a random sample of nine bags drawn from a week's production. (i) Find the mean and standard deviation of the probability distribution of M. (ii) Write down the probability density function of M. (iii) Draw, neatly and clearly, the probability density function of W and M on the same diagram. (iv) Compute the probability that M differs from the mean by less than 0.05kg.
- (d) Mrs.Flintron, the manager of an apartment complex, bought a lot of 100 bags of Amazing Salt in October 2018 .Find the mean and variance of T where T is the total weight contained in the lot under consideration. Then compute the probability that T exceeds 4,000.00kgs.

2. A comprehensive survey conducted on behalf of the Association of Concerned Citizens revealed that seventy percent of the adult respondents of a large metropolis were satisfied with the quality of maintenance of the roads in their city.

- (a) Compute the probability that in a random sample of twelve adult respondents more than six but fewer than ten were satisfied with the maintenance of the roads in their city.
  - (b) Use an appropriate approximation to compute the probability that in a random sample of 2,000 adult respondents more than 1,430 were satisfied with the maintenance of the roads in their city.
- 2.(a) Mr. MacLowy, an avid gardener, bought a lot of sixteen solar lights for installation in his backyard. He randomly selects eight of those lights and installs them in the backyard. What is the probability that at most two of these solar lights will not function properly if unknown to Mr.MacLowy the lot contained four substandard units?
- (b) Assume now that the lot purchased by Mr.MacLowy contained six substandard units. Compute the probability that a random sample of four solar lights contained more than two standard units.

3. An analysis of the data recorded on the telephone lines of ABCEX, an internet provider, reveals that the number of calls during working hours follows the Poisson law with an average of 3.6 calls per hour.

- (a) What is the probability that more than three calls are handled on a randomly selected hour?
- (b) Compute the probability that more than five but fewer than nine calls are handled on any two-hour period .
- (c) Use an appropriate approximation to compute the probability that more than 160 calls are handled in a week. Assume that a week has fifty working hours.
- (d) Compute the probability that three calls are handled on a given working hour while five calls are handled during the following hour. Explain, briefly and clearly, the thinking behind your computation.

4. The probability density function of the random variable Y is defined as follows:

$$f(y) = \begin{cases} Ky(9 - y^2) & 0 \leq y \leq 3 \\ 0 & \text{otherwise} \end{cases}$$

- (a) Find the value of K. Then sketch, clearly and neatly, the graph of f(y) against y.
- (b) Compute the mean of the probability distribution of Y.
- (c) Compute the variance of the probability distribution of Y.
- (d) Find the cumulative distribution function F(y), then sketch F(y) against y.

5. Twenty five measurements of the Brinell Hardness Test X carried out on a certain type of hardened aluminum yielded the following information:

$$\Sigma X = 1,800.0 ; \quad \Sigma X^2 = 129,654.0 ; \quad n=25$$

- (a) Find the 99% confidence limits of (i) the true mean and (ii) the true standard deviation of the probability distribution of X. Assume that X is a normally distributed random variable.
- (b) Test the hypothesis that the mean value of the probability distribution of X is not significantly different from 74.0. Let  $\alpha = 0.05$ .
- (c) Test the hypothesis that the true standard deviation of the probability distribution of X is not significantly different from 1.2. Let  $\alpha = 0.05$ .

6. KBF Corporation, a manufacturer of electric fans, has four assembly lines. Data collected by the quality control division on a given randomly selected four-week period yielded the following results:

	Assembly Line A	Assembly Line B	Assembly Line C	Assembly Line D
Number of Units Produced	12,000	11,400	12,500	11,900
Number of Substandard Units	600	691	673	536

Use an appropriate method to test the null hypothesis that the proportion of substandard units is the same for the four production lines against the alternative that they are different. Let  $\alpha = 0.05$ .

7. Honest Scientific Testing, also known as HST, was hired by the manufacturer of alarm systems to independently test the activation time of two makes of two equally priced switches used in the production of the alarm systems. Initially ten switches were randomly selected and thoroughly tested by HST. However, one of the switches was deemed substandard during the testing procedure and as a consequence the result yielded by this switch was discarded. All the other results are tabulated below:

	Make A	Make B
Sample size	$n_A = 10$	$n_B = 9$
Sample Mean (seconds)	$m_A = 19.5$	$m_B = 20.2$
Sample Standard deviation (seconds)	$s_A = 0.8$	$s_B = 0.6$

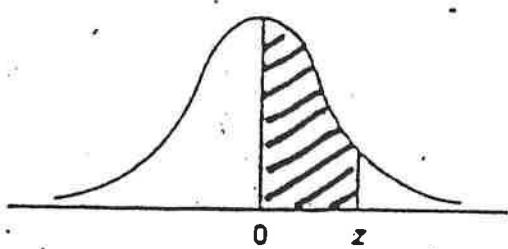

- (a) Test the hypothesis that the variability of the activation time of switches of Make A is not significantly different from that of Make B. Let  $\alpha=0.05$ . State any assumptions you need to make.
- (b) Test the hypothesis that the mean activation time of switches of Make A is not significantly different from that of Make B. Let  $\alpha = 0.05$ .

8. The following results were obtained from a survey carried out by professor Socrates. The survey followed a strict and rigorous protocol in order to ensure as much as possible the reliability of the results. It involved a random sample of twenty eight engineering students registered in an advanced professionally related subject. The variable X represents the number of hours a student devoted to the study of the subject under consideration during the academic year while Y represents the marks out of hundred.

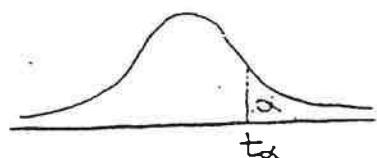

$$\sum_{i=1}^n X_i = 4,200.0 \quad ; \quad \sum_{i=1}^n X_i^2 = 654,300.0 \quad ; \quad \sum_{i=1}^n Y_i = 1,960.0;$$

$$\sum_{i=1}^n Y_i^2 = 148,000.0 \quad ; \quad \sum_{i=1}^n X_i Y_i = 307,284.0 \quad ; \quad n = 28$$

- (a) Compute the coefficient of correlation  $r$  of X and Y.
- (b) Find the 95% confidence limits of the true coefficient of correlation  $\rho$ .
- (c) Professor Socrates believed that Y and X are related by an equation of the form  $Y = \beta_0 + \beta_1 X + \epsilon$ . where  $\epsilon$  is a normally distributed random variable with mean equal to zero and unknown variance  $\sigma^2$ . Write down the normal equations of the least squares line and then compute the estimates  $b_0$  and  $b_1$  of  $\beta_0$  and  $\beta_1$  respectively.
- (d) Compute the error sum of squares and use this information to find the 95% confidence limits of  $\beta_1$ .
