

## National Exams December 2019

### 17-Ind-B1, Applied Probability & Statistics

3 hours duration

#### **NOTES:**

1. If doubt exists as to the interpretation of any question, the candidate is urged to submit with the answer paper, a clear statement of any assumptions made.
2. This is a closed book exam. One of two calculators is permitted – any Casio or Sharp approved model.
3. Candidates are permitted to have an aid sheet consisting of one 8.5" x 11.0" sheet of paper. Writing is permitted on both sides of the paper.
4. This exam consists of three sections (A→C). Within each section, candidates will be given a choice of questions to answer. Please read the instructions for each section carefully. A breakdown of questions and marks is as follows:

Section A:           Do 2 of 4 Questions. Total marks: 20

Section B:           Do 2 of 3 Questions. Total marks: 40

Section C:           Do 1 of 2 Questions. Total marks: 20

Exam:                5 Questions.              Total marks: 100

4. The value of each question is listed in the exam. Remember to check the instructions for each section. DO NOT ATTEMPT TO DO ALL QUESTIONS.
5. Statistical tables are provided. If, for any reason, a value is missing, please note this and use an approximate value.

**Section A – Basic Concepts:** Complete two of the following four questions. This section is worth a total of 30 marks. Do not attempt all questions.

1. A function  $f(x)$  given below:

$$f(x) = \begin{cases} \alpha x & 0 < x < 3 \\ 3 - 2x & 3 \leq x \leq 5 \\ 0 & elsewhere \end{cases}$$

- a) What value must  $\alpha$  be for  $f(x)$  to be a valid probability function? Why?
- b) Find the mean of the function, under the assumption that it is a valid pdf, using the value for  $\alpha$  you discovered in part a.
- c) Find the variance of the function using the value for  $\alpha$  you discovered in part a.

**10 Marks**

2. The IE Department at Northern Utopia Technical School (NUTS) went through a major curriculum change about 4 years ago. The faculty at NUTS surmise that on average, student marks have risen by about 6 percent under the new curriculum. To test this value, assume that the following cumulative grades for six students have been drawn at random:

Old Curriculum	New Curriculum
74.4	72.7
62.3	76.7
65.3	78.2
78.4	71.1
63.9	71.2
66.3	74.2

- a) Determine, using  $\alpha = 0.05$ , whether the variances from the two populations are the same.
- b) Using this information, develop a hypothesis test to test whether the difference in grades between the old and new curriculum is actually 6%. Use  $\alpha = 0.05$ . Please state any assumptions that you have made in developing your hypothesis test.
- c) Provide a 95% confidence interval for the average marks under the old curriculum.
- d) Does the confidence interval in (c) tell us whether the data point 78.4 could be considered an anomaly under the old curriculum?

**10 Marks**

3. An IE would like to validate her simulation model against a sample of data from a real-world system. She has five months of production data showing average job time in system (in minutes). She sets her simulation to run for a period of 1 simulated month and makes five independent replications. The following data is obtained.

Actual	Simulation
104	120
107	67
94	115
110	100
107	138

- a) Are the variances of these two samples the same? Use  $\alpha = 0.05$ .  
b) Test the hypothesis:

$$H_0: \mu_1 = \mu_2$$
$$H_1: \mu_1 \neq \mu_2$$

for this dataset at the  $\alpha = 0.05$  level and state any assumptions you make.

**10 Marks**

4. If x and y have the following joint probability function:

x	y			$p_x(x)$
	0	1	2	
0	0.05	0.10	0.20	0.35
1	0.05	0.15	0.05	0.25
2	0.25	0.10	0.05	0.40
$p_y(y)$	0.35	0.35	0.30	

- a) Find  $\rho_{xy}$   
b) Are x and y independent?

**10 Marks**

**Section B – Intermediate Concepts:** Complete two of the following three questions. This section is worth a total of 30 marks. Do not attempt all questions.

- The final class averages for 10 industrial engineering students taking OR I and Statistics has been compiled from historical records:

OR I	Statistics
86	80
75	81
69	75
74	81
90	92
94	95
83	80
86	81
71	76
65	72

- Assuming OR I to be the independent variable (i.e.  $x$ ), find a regression line relating Statistics marks ( $y$ ) to OR I marks.
- Test for the significance of the regression using  $\alpha = 0.05$ . To aid you in your calculations, you may assume that SST is 460.1.
- Test for the significance of the constant in the regression, using  $\alpha = 0.05$ .
- Estimate the correlation between a student's statistics mark and their OR I mark.
- If a student scores 60 in their OR I class, calculate the range of likely values for their Statistics mark. Again, use  $\alpha = 0.05$ .

**20 Marks**

- Historically, the median wait time for hip surgery in Nova Scotia has been 18 months (note – medians are used to measure waits to eliminate possible outliers in the data). Over the past 12 months, the following median wait times for hip surgery has been recorded as:

Month	1	2	3	4	5	6	7	8	9	10	11	12
Wait	15	19	16	17	18	12	21	17	14	19	17	16

- Using the sign test, determine ( $\alpha = 0.05$ ) if there is any evidence to suggest that the median wait time for hip surgery has changed over the past 12 months.
- If the probability that wait time exceeds 20 months is known from historical records to be 2% and wait time from month-to-month is assumed to be independent, what is the probability that exactly two months in a year exceeds 21 months?

- c. What is the probability that at least 2 months in a year will record wait times in excess of 20 months?

**20 Marks**

3. An IE is evaluating the work methods at four workstations in a plant that produces hops (a type of coniferous plant that is used in the brewing of beer). Each of the four workstations involves packing (i.e. gathering the hops into a Kevlar bag, weighing, and sealing). Each of the operators has been issued with the same standard procedure for packing. However, management feels that the resulting packing times are not the same. A sample of three cycles was collected at each workstation. The resulting times (in seconds) are listed below:

WS 1	WS 2	WS 3	WS 4
25.6	25.2	20.8	31.6
24.3	28.6	26.7	29.8
27.9	24.7	22.2	34.3

Please note that the variance for entire sample is 9.51

- a) Perform an analysis of variance at  $\alpha = 0.05$  level of significance.
- b) Determine, using Bartlett's test, if the cycle time variances is constant between the workstations. Assume a significance level of 0.05. Comment on the results of this test with respect to your answer in part (a).
- c) Use Tukey's test to determine which, if any, of the workstations has a significantly different cycle time. Use an  $\alpha = 0.05$ .
- d) An alternate method to part (c) might be to conduct a pair-wise comparison of means for each possible combination of workstations. How many tests would be required to complete a full pair-wise comparison? What would the confidence level have to be set at for each of the comparisons to ensure an overall confidence of  $\alpha = 0.05$ .

**20 Marks**

**Section C – Advanced Concepts:** Complete one of the following two questions. This section is worth a total of 20 marks. Do not attempt all questions.

- After running several marathons, a runner has become convinced that her performance (as measured in time to complete the race) is a function of three elements:  $x_1$  – total number of kilometres \*100 run in the six weeks prior to the race;  $x_2$  – the longest single run completed during the six weeks prior to the race; and  $x_3$  – the expected temperature on race day. To test this hypothesis, the runner has collected the following dataset:

$x_1$ Total km (*100)	$x_2$ Max Dist	$x_3$ Temp	y Time (Hrs)
4.6	27	11	4.3
4.5	31	10	3.8
4.0	30	25	3.5
4.1	25	22	3.6
4.4	28	14	3.5
4.2	32	17	3.4

The relationship between completion time and  $(x_1, x_2, x_3)$  is assumed to be linear in the region of interest.

- Build the  $(X'X)$  matrix.
- A partial table of  $(X'X)^{-1}$  is given below, where \* , \*\*, and \*\*\* remain to be determined:

3186.5127	*	-10.0932	-22.9764
-585.1664	108.4063	1.7075	4.2294
-10.0932	1.7075	0.0562	**
-22.9764	***	0.0685	0.1706

- Assume that  $(X'X)^{-1}(X'Y)$  is:

-16.29491
4.1060
0.0093
0.1245

Calculate SSE, SSR, and SST.

- d. Complete the ANOVA table for this regression model ( $\alpha = 0.05$ ) and determine whether the linear model is a significant predictor of  $y$ .  
e. Determine if any of the coefficients in your model is significant at the 95% level.  
f. Based on your analysis, is the model a good predictor of race finishing time?

**20 Marks**

- 2) The following dataset is part of a  $2^3$  designed experiment to determine the effects of cutting speed (A), tool geometry (B), and cutting angle (C) on the life of a machine tool. Two levels of each factor are chosen, and duplicates were run at each design point.

Run	A	B	C	Rep 1	Rep 2
1	-1	-1	-1	32	31
2	1	-1	-1	15	43
3	-1	1	-1	35	34
4	1	1	-1	35	47
5	-1	-1	1	44	45
6	1	-1	1	40	37
7	-1	1	1	60	50
8	1	1	1	39	41

- a. Complete the rest of the design matrix for the four interactions  
b. Compute the contrast and mean effects for the A factor, the AB factor, and the ABC factor (see the contrast table below)  
c. Calculate the sum of squares for the A factor, the AB factor, and the ABC factor. See the Sum of Squares table below.  
d. Assuming the updated contrast and Sum of Squares, calculate the ANOVA table for this model. Assume  $\alpha = 0.05$ .

**Contrasts**

A	B	C	AB	AC	BC	ABC
-34	*	84	**	-50	-6	***

**Sum of Squares**

SS(A)	SS(B)	SS(C)	SS(AB)	SS(AC)	SS(BC)	SS(ABC)	SST
*	182.25	**	0	***	2.25	81	1457

- e. Factor and interaction terms are significant (if any).  
f. Fit a linear regression model to the data.

**20 Marks**

**Areas Under the Normal Curve**

<b>z</b>	<b>0.00</b>	<b>0.01</b>	<b>0.02</b>	<b>0.03</b>	<b>0.04</b>	<b>0.05</b>	<b>0.06</b>	<b>0.07</b>	<b>0.08</b>	<b>0.09</b>
